 $2 \times 3; -7$

12. $\begin{bmatrix} 3 & 1 \\ -5 & 0 \\ 7 & 6 \end{bmatrix}; a_{21}$
 $3 \times 2; -5$

13. $\begin{bmatrix} 5 & 1 & -2 \\ 4 & -7 & 12 \\ 0 & 78 & 3 \end{bmatrix}; a_{32}$
 $3 \times 3; 78$

Use the matrix at the right for Exercises 14–16.

14. How many points has Tamika scored? **226**

15. How many three-point shots has Tran made? **50**

16. What percent of Johanna's points were from one-point shots? **about 9%**

	1-pt Shots	2-pt Shots	3-pt Shots
Tamika	22	30	48
Johanna	21	31	48

- matrix addition
- two equal matrices
- a zero matrix
- a matrix equation

23. $\begin{bmatrix} 18 & 3 & 0 & 24 \\ -12 & 9 & 21 & 33 \end{bmatrix}$

24. $\begin{bmatrix} -9 & 7 \\ -8 & -8 \end{bmatrix}$

25. does not exist

26. $\begin{bmatrix} -6 & 10 & 21 & 41 \\ -28 & 10 & 28 & 28 \end{bmatrix}$

34. $\begin{bmatrix} 6 & -4 & 2 \\ 2 & 0 & 10 \end{bmatrix}$

35. $\begin{bmatrix} -1 & 0 & -5 \\ 3 & -2 & 1 \end{bmatrix}$

4-2 and 4-3 Objectives

- ▼ To add and subtract matrices (p. 170)
- ▼ To solve some matrix equations (p. 172)
- ▼ To multiply a matrix by a scalar (p. 178)
- ▼ To multiply two matrices (p. 180)

To perform **matrix addition** or subtraction, add or subtract the corresponding elements in the matrices. To obtain the **scalar product** of a matrix and a **scalar**, multiply each matrix element by the scalar. **Matrix multiplication** uses both multiplication and addition. The element in the i th row and j th column of the product of two matrices is the sum of the products of each element of the i th row of the first matrix and each element of the j th column of the second matrix. The first matrix must have the same number of columns as the second has rows.

Two matrices are **equal matrices** when corresponding elements are equal and they have the same dimensions. This principle is used to solve a **matrix equation**.

Solve each matrix equation for matrix X .

17. $\begin{bmatrix} 2 & -6 & 8 \end{bmatrix} + \begin{bmatrix} -1 & -2 & 4 \\ 1 & -8 & 12 \end{bmatrix} = X$ 18. $\begin{bmatrix} t \\ 6 \end{bmatrix} - \begin{bmatrix} 1 \\ 3 \end{bmatrix} = X \begin{bmatrix} t-1 \\ 3 \end{bmatrix}$

19. $\begin{bmatrix} 7 & -1 \\ 0 & 8 \end{bmatrix} + X = \begin{bmatrix} 4 & 9 \\ -3 & 11 \end{bmatrix} \begin{bmatrix} -3 & 10 \\ -3 & 3 \end{bmatrix}$ 20. $X - \begin{bmatrix} -7 & 13 & 5 \\ 31 & 0 & -4 \end{bmatrix} = \begin{bmatrix} 9 & -5 \\ 2 & 0 \end{bmatrix}$

Solve for each variable.

21. $\begin{bmatrix} x-5 & 9 \\ 4 & t+2 \end{bmatrix} = \begin{bmatrix} -7 & w+1 \\ 8-r & 1 \end{bmatrix}$ 22. $\begin{bmatrix} -4+t & 2y \\ r & w+4 \end{bmatrix} = \begin{bmatrix} 2t \\ -2r+12 \end{bmatrix}$

$x = -2, w = 8, r = 4, t = -1$ $t = -4, y = \frac{11}{2}, r = 4, w = 5$

Use matrices $A, B, C,$ and D . Find each scalar product, sum, or difference, if possible. If an operation is not defined, label it *undefined*. 23–27. See margin.

$A = \begin{bmatrix} 6 & 1 & 0 & 8 \\ -4 & 3 & 7 & 11 \end{bmatrix}$ $B = \begin{bmatrix} 1 & 3 \\ -2 & 4 \end{bmatrix}$ $C = \begin{bmatrix} -2 & 1 \\ 4 & 0 \\ 2 & 2 \\ 1 & 1 \end{bmatrix}$ $D = \begin{bmatrix} 5 & -2 \\ 3 & 6 \end{bmatrix}$

23. $3A$ 24. $B - 2D$ 25. AB 26. BA 27. $AC -$

4-4 Objectives

- ▼ To represent translations and dilations with matrices (p. 187)
- ▼ To represent reflections and rotations with matrices (p. 189)

A **transformation** is a change made to a figure. The original figure is the **preimage** and the transformed figure is the **image**. A **translation** slides a figure without changing its size or shape. A **dilation** changes the size of a figure. You can use matrix addition to translate a figure and scalar multiplication to dilate a figure.

You can use multiplication by the appropriate matrix to perform transformations that are specific **reflections** or **rotations**. For example, to reflect a figure in the y -axis, multiply by $\begin{bmatrix} -1 & 0 \\ 0 & 1 \end{bmatrix}$. To rotate a figure 180° , multiply by $\begin{bmatrix} -1 & 0 \\ 0 & -1 \end{bmatrix}$.

For Exercises 28–35, use $\triangle ABC$ with vertices $A(3, 1), B(-2, 0),$ and $C(1, 5)$. Write the coordinates of each image in matrix form. 28–35. See margin.

28. a translation 1 unit right and 2 units down
29. a translation 3 units left and 4 units up
30. a reflection in the y -axis 31. a reflection in the line $y = x$
32. a rotation of 270° 33. a dilation half the original size
34. a dilation twice the original size 35. a rotation of 90°

A **square matrix** with 1's along its main diagonal and 0's elsewhere is the **multiplicative identity matrix, I** . If A and X are square matrices such that $AX = I$, then X is the **multiplicative inverse matrix** of A , A^{-1} .

You can use formulas to evaluate the determinants of 2×2 and 3×3 matrices.

$$\begin{vmatrix} a & b \\ c & d \end{vmatrix} = ad - bc \quad \begin{vmatrix} a_1 & b_1 & c_1 \\ a_2 & b_2 & c_2 \\ a_3 & b_3 & c_3 \end{vmatrix} = a_1b_2c_3 + a_2b_3c_1 + a_3b_1c_2 - a_1b_3c_2 - a_2b_1c_3 - a_3b_2c_1$$

You can use a calculator to find the inverse of a matrix. The inverse of a 2×2

matrix can be found by using its determinant.
$$\begin{bmatrix} a & b \\ c & d \end{bmatrix}^{-1} = \frac{1}{ad - bc} \begin{bmatrix} d & -b \\ -c & a \end{bmatrix}$$

You can use inverse matrices to solve some matrix equations.

You can also use inverse matrices to solve some systems of equations. When equations in a system are in standard form, the product of the **coefficient matrix** and the **variable matrix** equals the **constant matrix**. You solve the equation by multiplying both sides of the equation by the inverse of the coefficient matrix. If that inverse does not exist, the system does not have a unique solution.

Evaluate the determinant of each matrix, and find the inverse, if possible.

36–39. See margin.

36. $\begin{bmatrix} 6 & 1 \\ 0 & 4 \end{bmatrix}$ 37. $\begin{bmatrix} 5 & -2 \\ 10 & -4 \end{bmatrix}$ 38. $\begin{bmatrix} 10 & 1 \\ 8 & 5 \end{bmatrix}$  39. $\begin{bmatrix} 1 & 0 & 2 \\ -1 & 0 & 1 \\ -1 & -2 & 0 \end{bmatrix}$

Use an inverse matrix to solve each equation or system. 40–43. See margin.

40. $\begin{bmatrix} 3 & 5 \\ 6 & 2 \end{bmatrix} X = \begin{bmatrix} -2 & 6 \\ 4 & 12 \end{bmatrix}$ 41. $\begin{cases} x - y = 3 \\ 2x - y = -1 \end{cases}$ 42. $\begin{bmatrix} 4 & 1 \\ 2 & 1 \end{bmatrix} \begin{bmatrix} x \\ y \end{bmatrix} = \begin{bmatrix} 10 \\ 6 \end{bmatrix}$

43. $\begin{bmatrix} -6 & 0 \\ 7 & 1 \end{bmatrix} X = \begin{bmatrix} -12 & -6 \\ 17 & 9 \end{bmatrix}$ 44. $\begin{cases} x + 2y = 15 \\ 2x + 4y = 30 \end{cases}$  45. $\begin{cases} a + 2b + c = 14 \\ b = c + 1 \\ a = -3c + 6 \end{cases}$

Cramer's Rule for solving systems of equations uses determinants to solve for each variable. D is the determinant of the coefficient matrix. D_y is the determinant formed by replacing the coefficients of y in D with the constant terms.

You can also use **row operations** on an augmented matrix to solve a system.

Solve each system using Cramer's Rule. Check your answers by solving each system using an augmented matrix.
